## The Empirical Basis for Action

Clifton R. Conrad  
Mary Talbott

The purpose of this paper is to examine the demographic transformation of Arizona and to explore the implications of that challenge for the future of higher education in the state. Since the changing size and character of the minority population figures so prominently on the demographic landscape, the major focus will be on changes in the minority population and the implications of those changes for future minority participation in higher education. The paper is divided into three major sections. The first section highlights several important characteristics of the population of Arizona, placing major emphasis on the minority component. The second section focuses on current minority participation in education, particularly higher education. In the context of the demographic trends discussed and current minority participation in higher education, the concluding section raises a number of issues about the future of minority participation in higher education in the State of Arizona.

Before turning to the opening section, several caveats are in order. First, the reader should be apprised of the fact that there are some substantial gaps in the data on the demographic characteristics of Arizona residents. Unfortunately, it is especially difficult to find and capture data on minorities in Arizona, both in the population at large and within higher education. (In the latter case, it is interesting to note that some higher education institutions have almost no data on minority students, while others simply refuse to release their data.) While several fugitive studies were found which helped to enrich the data base used here, it should be acknowledged that the analyses--and perhaps some findings--presented in this paper were shaped in part by the availability of data. Second, owing to data gaps as well as changing data categories used in some sources of information, it was difficult in many instances to identify trends in the data. While trends are discussed whenever the data allow, the lack of compatibility in some of the data and the absence of the necessary information, frequently militated against trend analysis. Third, while we assume that the data used here are accurate, it must be acknowledged that there is no assurance that these data are valid. Fourth, the reader should recognize that the categories used by the Bureau of Census in the **1980 Census of Population** are not mutually exclusive. Individuals claiming an ethnic identification also are members of a racial group. Because

the categories are not always mutually exclusive, they are not always summative or additive. In light of the available data, we have operationally defined the minority population as indicated in Table 2.

## Demographic Profile of Arizona

This section presents a statistical portrait of the demographic landscape in Arizona by examining selected characteristics of the population and, where possible, trends in those characteristics over time. The first part provides an overall demographic profile of the state except in terms of racial/ethnic composition, and the second looks specifically at the demographic characteristics of the minority population. Throughout this section data are presented for the entire state and, in some instances, for the fourteen individual counties that make up the State of Arizona. \*(Editor's note: since this was written, La Paz county has been divided away from Northern Yuma County, making a total of fifteen counties.)

### Overall Demographic Profile

This part of the paper examines three major demographic characteristics of the state's population: size and distribution, age, and sex.

**Population size and Distribution.** Based on 1980 census data, the population of Arizona now includes more than 2,700,000 inhabitants. This figure represents an increase of 51 percent from 1970 to 1980, making Arizona the second-fastest growing state in the nation (next to Nevada) over the last decade. According to projections of future population growth, Arizona is expected to increase its population to approximately 4,600,000 inhabitants by the year 2000, which would represent an increase of about 70 percent over the next two decades. As in most Sun Belt states, Arizona has grown rapidly in the last several decades and that growth is expected to continue, albeit at a somewhat slower rate than in the last twenty years.

The State of Arizona is divided into fourteen counties (Editor's note: see previous note on La Paz county), as shown in Figure 1. According to 1980 census figures, slightly less than 25 percent of the Arizona population is located in the twelve largely rural counties. This quarter of the population is distributed fairly evenly across the twelve counties, with population ranging from 11,406 in Greenlee to 90,918 in Pinal county. (Editor's note: Yuma County was recently divided into Yuma and La Paz counties, with the latter having about 14,000 residents.)

The remaining 75 percent of the state's population (2,040,495 out of 2,718,215 statewide inhabitants) lives in Maricopa or Pima County. The population of Maricopa is slightly over one and one-half million people, including nearly 800,000 residents of the city of Phoenix, while Pima County has about 530,000 residents of whom approximately 330,000 reside in the City of Tucson. Broken into percentages, 55.5 percent of the state's population lives in Maricopa County and 19.6 percent in Pima County. Interestingly, the proportion of the state's population residing in these two counties had changed little in the last decade, increasing only slightly from 74.3 percent in 1970 to 75.1 percent in 1980. According to projections of the Arizona Department of Economic Security, the proportion of the state's population living in the two most populated counties is expected to

stay roughly the same over the next several decades. In summary, Arizona's population continues to grow rapidly, with three-fourths of the population located in Pima and Maricopa counties. The heavy concentration of the population in Metropolitan Phoenix and Tucson is expected to continue into the next century.

### **Age of the Population.**

Because Arizona attracts retired citizens from other states, there is a widespread belief that Arizona's population is relatively older than in most other states. This belief, like most myths, combines elements of both truth and fiction. On the one hand, the state's median of 29.2 is slightly above the national average, as is the 11.3 percent of the population that is 65 years and older. On the other hand, the model age cohort of Arizona residents is 20-24 years, and the percentage of the population under 5 years of age is 7.9 percent, a figure slightly higher than the national average. Therefore, while there is a relatively larger number of older persons in Arizona compared to other states, this demographic fact should not obscure an equally telling point: Arizona's population under 50 years of age is actually slightly more youthful than in many other states in the nation.

Turning from a statewide perspective to the county level, it should be noted that there is a rather striking variation in the age of the population across the fourteen counties in Arizona. The median age of the population ranges from 20.6 years in Apache County to 39.2 years in Yavapai County. Five counties have a median age above the statewide average median age of 29.2, while the other nine have a median age below that figure. As would be expected given their three-quarters share of the state's total population, the median age of the population in the two most populous counties is very close to the statewide median age; the median age is 29.7 in Maricopa County and 29.5 in Pima county. The influence of Maricopa and Pima counties notwithstanding, perhaps the most salient point is that several of the rural Arizona counties (such as Apache and Navajo) have a substantially younger population than that of the rest of the state.

### **Sex of the Population**

In terms of the gender of its inhabitants, Arizona reflects the gradual national trend toward a slightly higher female proportion of the total population. In the 1980 census, 50.8 percent of the population was identified as female. As would be expected, there is relatively little variation in the gender of the population across the fourteen counties. The percentage of females in the population ranges from 48.6 percent in Pinal county to 52.6 percent in Santa Cruz County, with the figure in Maricopa and Pima Counties at about 51 percent. Especially given the higher mortality rates of men and the fact that a substantial part of the state's population is over 50 years of age, it seems likely that Arizona's population will continue to become gradually more female in the coming decades.

### **Demographic Profile of Minorities in Arizona**

While the State of Arizona is clearly being transformed in terms of the demographic characteristics discussed above, nowhere is the change more dramatic—and perhaps less understood—than in terms of the minority population. Within

the last decade alone, there have been several major trends in the size and composition of the minority population. Because certain changes in the size and nature of the state's ethnic/racial population seem to have important implications for higher education, this part of the paper examines several characteristics of the minority population that may have special significance for higher education. Three such characteristics are examined below: size and distribution, age, and English fluency.

## **Population Size and Distribution**

The minority population of Arizona—including Blacks, Native Americans (which include American Indians, Eskimos, and Aleuts), Asians and Pacific Islanders, and persons of Spanish origin—has grown rapidly in the past several decades. Although changes in the reporting categories used in the U.S. Census of Population from 1970 to 1980 preclude longitudinal analysis of census data, unofficial figures establish that Arizona has increased both the number and proportion of its minority population in recent years. Moreover, growth in the Arizona minority population is expected to continue to be markedly greater than in the non-minority population over the next several decades.

According to 1980 census figures, the total number of minorities in the state is 690,455, or 25.4 percent of Arizona's total population of 2,718,215. (Because individuals included in the "Other" category of the 1980 census were not identified as minorities, the figures presented here clearly underestimate the minority population.) As displayed in Table 1, the largest minority group is comprised of persons of Spanish origin—over 440,000 people, or nearly one out of every six Arizonans, is Hispanic. While Blacks, and Asians and Pacific Islanders, combine for nearly 4 percent of the population, a figure substantially below the national averages for those two groups (especially for Blacks), Native Americans comprise 5.6 percent of the state's population. Next to California, Texas, and New Mexico in the Sun Belt region, Arizona has one of the largest—and most ethnically and racially diverse—minority populations in the Southwest.

Examination of the distribution of the minority population across the state reveals that minorities make up a large proportion of the population outside of heavily-populated Maricopa and Pima counties. Of the state's fourteen counties, ten have at least a 30 percent minority population and four have more than a 50 percent minority population (see Table 2). Significantly, only Mohave, Yavapai, Pima, and Maricopa counties have less than a 30 percent minority population.

When the minority population is disaggregated (see Table 3) and examined in terms of its distribution across the state, it is clear that certain minority groups are more likely than others to live outside the two most populous counties. Most significantly, 75.25 percent of the Native Americans in Arizona live outside of Pima and Maricopa counties. Most of these Native Americans live in counties such as Apache and Navajo in which Indian reservations are located (see Figure 2). And, as would be expected, other minorities living outside of Pima and Maricopa counties tend to concentrate in certain areas of the state: Blacks are most likely to reside in Cochise, Pinal, and Yuma counties; Spanish-Americans are most likely to live in Pinal, Santa Cruz, Cochise, and Yuma Counties; and Asians and Pacific Islanders are most likely to settle in Cochise County.

While the distribution and concentration of the minority population across the

state are notable features of the demographic landscape, fully 62.2 percent of the minorities in Arizona live in Maricopa or Pima County. That this figure is approximately 13 percent less than the 75.1 percent of the total population living in these two counties does not appreciably diminish its overall significance. For as can be inferred from Table 3, this percentage differential seems to be explained by the fact that the non-minority population is most likely to live in Maricopa or Pima counties. Indeed 78.1 percent of the state's non-minority white population resides in these two counties, as does 84.3 percent of the Black population; 24.8 percent of the Native Americans; 81.9 percent of the Asian and Pacific Islander population; and 70.4 percent of the Hispanic population. With the exception of Native Americans, a substantial majority of all minority groups in Arizona are concentrated in the counties in which Phoenix and Tucson are located.

In summary, the minority population now comprises more than one-fourth of Arizona's total population and is growing rapidly. While Spanish-Americans are the largest minority group, Arizona has a heterogeneous minority population--including a large number of Native Americans and a fairly substantial number of Blacks, and Asians and Pacific Islanders. Significantly, in all but two of the state's rural counties, minorities comprise more than 30 percent of the population, with the various racial and ethnic groups tending to concentrate in certain counties. In terms of absolute numbers, however, over three-fifths of Arizona's minorities live in Maricopa or Pima counties. Except for Native Americans, a large proportion of the minority population lives in the urban areas of Tucson and Metropolitan Phoenix.

### **Age of the Minority Population**

Another important characteristic of the minority population that requires consideration is age with respect to racial or ethnic background. Significantly, the minority population is quite young, especially in relation to the non-minority population. In terms of the median age of their population, all four of the major minority groups have a median age under the statewide average of 29.2 years for the total population. While the median age of Asians and Pacific Islanders is only slightly below that average, the three other minority groups have much lower median ages: 23.7 for Blacks, 21.7 for Hispanics, and 19.8 for Native Americans. For each of these latter three groups, over one-half of their population is under 24 years of age. As displayed in Table 4, these same three groups have a modal age of 20-24 for all Arizona residents. (The modal age of Asians and Pacific Islanders is in the 25-29 category; however, as Table 4 shows, there are only 14 more people in that cohort than the 20-24 age group.) Perhaps most significant is the modal age of Hispanics, which is the 4-years-of-age-and-under category. Hispanics are very young indeed, even when compared with other minority groups.

Given that the future size and composition of Arizona's population will, in large measure, be determined by the characteristics of the current population, the most significant fact about the current minority population may be this: While minorities now constitute 25.4 percent (estimated conservatively) of the Arizona population, they comprise 33.8 percent of the state's population under 25 years of age. When the minority population under 25 years of age is broken into sub-groups, roughly two-thirds of the total minority population is made up of Hispanics across all five

of the age cohorts listed in Table 5. Native Americans constitute the second-largest group, followed by Blacks and Asians and Pacific Islanders. To repeat, the most arresting fact about the minority population--and especially Hispanics and Native Americans--is that it is much younger than the rest of the state's population.

## **English Fluency of the Population**

Owing to the large minority population in Arizona, it is not surprising that there are over 78,381 persons in the state over 4 years of age who are not fluent in the English language. According to 1980 census figures, this means that approximately 2.9 percent of the total state population is not fluent in English. When the English fluency of the population is examined on a county-by-county basis, it is noteworthy that the two counties (Apache and Santa Cruz) with the largest minority populations (dominated by Native Americans and Hispanics, respectively) have the largest percentage of non-English speaking residents. While available data do not establish that English fluency is inextricably linked to the minority composition of the state, it seems likely that many persons not fluent in English are members of the minority population, and further, that they are most likely members of the Hispanic and Native American sub-populations. When that assumption is coupled with the fact that approximately 3 percent of the state's population is not fluent in English, it would seem that the multi-cultural character of the state's population requires a response by institutions of higher education.

Having examined selected demographic information and highlighted several minority population characteristics, we now turn to an exploration of the minority population in the Arizona educational pipeline.

## **Minority Participation in Education**

It is no small task to investigate the success of minorities in the educational pipeline that runs from elementary and secondary education through the community colleges and the state's senior postsecondary institutions. The most commonly used approaches to looking at the educational pipeline--such as examining statewide cohort survival data or graduation rates--cannot be used for lack of relevant data. Still, this issue can be examined by analyzing available information on minority participation in education which, in turn, provides a foundation for drawing some tentative conclusions about how well minorities are being served by institutions of higher education.

In examining minority participation in education, and especially higher education, this section of the paper addresses two central questions: 1) To what degree are minorities participating in education from high school through graduate and professional education? 2) To what degree have minorities achieved equal access throughout the educational pipeline as indicated by the extent to which the student population and the population of the state or county are similar with respect to racial composition and ethnic background? In responding to these two questions, this section is divided into two parts. From a statewide perspective, the first part looks at minority participation at all levels--Arizona's high schools, community colleges, and senior postsecondary institutions. The second part examines minority participation in the state's community colleges and senior institutions from the

perspective of individual institutions.

**Minorities in the Educational Pipeling: A Statewide Perspective Minority Participation in the Senior Year of High School.** In the absence of high school graduation rates by racial and ethnic group, it is informative to examine the percentage of minority enrollment in the senior year of high school throughout the State of Arizona. As shown in Table 7, minorities are well-represented, comprising nearly 27 percent of the senior class in 1981. As would be expected, the relative ranking of the four racial and ethnic groups that comprise the minority population in the senior year of high school reflects the minority composition of the state: Hispanics are most heavily represented, with over three-fifths of the state's senior minority students being persons of Spanish origin, followed by a substantial proportion of Native Americans, Blacks, and Asians and Pacific Islanders.

As shown in Table 7 minorities are represented in the senior year population in slightly greater proportion than in the general population of Arizona. However, when compared with the state population in the 15-19 age cohort (see Table 7), a more appropriate comparison group, they are found to be underrepresented in the senior class: minorities comprise 32.4 percent of the total population from age 15-19, but only 26.7 percent of the senior class. Thus, it may be concluded that a lesser proportion of minorities make it to their senior year of high school than is the case with the non-minority population (the only minority groups that are an exception is Asians and Pacific Islanders). In summary, while minorities make up a substantial segment of the population in the senior year of high school, they are clearly dropping out of school before their senior year of high school at a higher rate than non-minority students.

**Minority Participation in Community Colleges.** Arizona's public postsecondary structure is a two tier system made up of community colleges and senior universities (see Figure 3). The first tier includes fifteen community colleges with twenty-seven campuses and three skill centers located in nine community college districts throughout the State of Arizona. The community colleges are governed by local boards with a coordinating board at the state level. The second tier is made up of three senior universities: The University of Arizona, Arizona State University, and Northern Arizona University. These three institutions are governed by a single statewide governing board, the Board of Regents.

Of the 117,397 students enrolled in community colleges in 1982, 21,694, or 18.8 percent of all community college students were minority students. Interestingly, the percentage of minority participation in community colleges varies considerably in terms of the full- and part-time status of students: 25.4 percent of the full-time students are minorities, while only 16.6 percent of the part-time students are members of an ethnic or racial minority group. This latter figure may be an important one, for slightly more than three-fourths of all students enrolled in community colleges are enrolled on a part-time basis.

When the minority enrollment (both full- and part-time) is examined by subgroups, Hispanics--as would be expected--make up the largest proportion of the minority population. Native Americans make up the second largest segment of minority students, followed closely by Blacks and then Asians and Pacific Islanders. When the relative proportion of each of these minority groups in community colleges is compared with their relative proportion in the senior year of high school, an important trend can be seen: Blacks, Asians and Pacific Islanders, increase

their relative share of the minority population at the community college level, while Hispanics and Native Americans decrease their relative share. Put another way, a greater proportion of Blacks, and Asians and Pacific Islanders, go on to community colleges after high school than do Hispanics and Native Americans.

To what degree have minorities achieved equal access in community colleges, as measured by the extent to which the student population and the population of the state are similar vis-a-vis racial composition and ethnic background? As displayed in Table 8, minorities account for a substantially smaller proportion of the population in the community colleges than in either the entire state population or the 18-24 cohort. However, the differences among minority groups are striking: Hispanics and Native Americans are substantially underrepresented, Blacks are only slightly underrepresented, and Asians and Pacific Islanders are slightly over represented. These differences notwithstanding, the fact remains that community college participation represents a narrowing of the educational pipeline for many minority students. In particular, Hispanics and Native Americans--who make up over four-fifths of the state's minority population--go to community colleges at a much lower rate than non-minorities.

**Minority Participation in the State Universities.** While the community college represents a narrowing of the educational pipeline for minorities, it is at the senior institutions that the pipeline becomes most severely constricted--first at the undergraduate, then at the graduate level. At the undergraduate level, Table 9 shows that minorities make up slightly more than 10 percent of the total enrollment at the University of Arizona, Arizona State University, and Northern Arizona University. (For each minority group, there was not an appreciable difference between full- and part-time enrollment). This represents a decline of nearly 9 percent from the 18.8 percent minority enrollment in community colleges. This decline in the proportion of minority participation from the two-year to the four-year institutions is shared almost equally across the respective racial and ethnic groups, with one exception: Asians and Pacific Islanders, whose proportion of the total minority enrollment increases slightly in the four-year institutions.

The underrepresentation of minorities in the undergraduate population in the state's three universities is clearly seen in comparisons between the student population and the minority composition of the Arizona population (see Table 9): Except for Asians and Pacific Islanders, each of the minority groups examined here is underrepresented at the undergraduate level across the state's three senior institutions. Most significantly, Hispanics and Native Americans make up 21.8 percent of Arizona's total population yet comprise only 7.0 percent of the undergraduate enrollment in Arizona's three public universities.

At the graduate level, both for graduate and professional programs, the pipeline is narrowed even further. As shown in Tables 10 and 11, ten percent of the enrollment in professional programs is made up of minorities, while the figure is only 5.5 percent in graduate programs. This indicates a decline of 4.9 and .4 percent respectively from the 10.4 percent minority enrollment at the undergraduate level. The underrepresentation of minorities is clearly seen in comparison between the student population and the Arizona population: while 25.4 percent of the state's population is minority, minorities make up less than 16 percent of the combined graduate and professional school enrollment. With the exception of Asians and Pacific Islanders, each of the minority groups is highly underrepresented in the

graduate population of the state's three public universities. Of the minority groups, Native Americans are the most underrepresented, followed by Hispanics and Blacks.

## Summary

As summarized in Figure 4, minority participation in education vis-a-vis the non-minority population varies directly with the level of education: the higher the level, the less the minority participation. At one end of the continuum used here, the senior year of high school, minorities make up 26.7 percent of the total student population. At the other end, the graduate level at the state's three universities, minorities comprise only 5.5 percent of the student population.

When the minority population is disaggregated by racial and ethnic group, there is considerable variation across the groups. Asians and Pacific Islanders actually increase their relative proportion of the total student population through the educational pipeline, although there is a slight drop in their participation at the graduate level. Meanwhile, Blacks show only a gradual drop in participation from the senior year in high school to community college level, after which participation declines moderately through the undergraduate and graduate levels. Hispanics, the state's largest minority group, show a sharp and steady decline in participation through the pipeline, with only one exception: Spanish-American participation at the graduate professional level is slightly higher than at the undergraduate level. Native-Americans, the second largest minority group, show a steep and steady decline in participation throughout the educational pipeline.

To what degree minorities achieved equal access throughout the pipeline is indicated by the extent to which the student population and the population of the state are similar with respect to racial composition and ethnic background? Based on this criterion, it is clear that minorities have not achieved access at any key point in the pipeline, and further, that access declines with the level of education. At every level, from the senior year of high school through graduate and professional school, minorities are consistently underrepresented compared to the minority population profile in Arizona--and that underrepresentation increases markedly with the level of education. The only minority groups that are an exception to this pattern of underrepresentation are Asian and Pacific Islanders.

Where are the major leakage points in the educational pipeline? Unfortunately, this is a question that cannot be answered fully with data pertaining only to minority participation. For without graduation rates (or ideally, cohort survival data), it is impossible to tell at which grades or levels, or after which levels, leakage occurs. For example, cohort survival from grade 10 to grade 11 may be drastically reduced for minorities, indicating a primary leakage point; and a secondary leakage point may be occurring after high school graduation and before college entry. Nevertheless, the data examined here on minority participation establish that there is leakage throughout the educational pipeline, with major leakage occurring somewhere between minority participation in high school and in community colleges and minority participation in the state's senior colleges and universities. (It also seems likely that considerable leakage occurs before the senior year of high school, but again, that cannot be determined because of the absence of the necessary data). Thus, while the specific leakage points cannot be identified here, it is clear

that minorities are dropping out at a much higher rate than non-minorities during or after (or both) every key point in the educational pipeline.

In conclusion, minorities comprise over one-quarter of the state's population. Yet, with the exception of Asians and Pacific Islanders, they are underrepresented in the educational pipeline. At every educational level examined here, minorities are consistently underrepresented, and further, that underrepresentation increases markedly with the level of education. That the specific leakage points cannot be identified does not undermine the most telling conclusion of all: Hispanics, Native Americans, and Blacks are a long way from achieving equal access to higher education in the State of Arizona.

## **Minorities in Higher Education: An Institutional Perspective**

Turning from a statewide to an institutional perspective, this brief section examines minority participation in individual postsecondary institutions. After an examination of minority participation in each of the State's fifteen public community colleges, the three senior institutions are reviewed in terms of their minority enrollment.

**Minority Participation in the Fifteen Community Colleges.** As shown in Table 12, there is striking variation in minority participation across the fifteen community colleges in Arizona. Nine have a percentage of minority students that exceeds the statewide average of 18.8 percent for all community colleges; the remaining six institutions fall below that percentage--in some instances, far below that figure. Interestingly, the variation in minority enrollment cuts across the urban and rural community colleges: five of the seven two-year colleges outside of heavily populated Maricopa and Pima counties have a minority population that exceeds that average. To illustrate the range of variation, it is instructive to compare two colleges at the extremes. At Mohave Community College only 5.1 percent of the students are minorities, while at South Mountain 77.8 percent of the students are members of a minority group. It is clear from Table 12 that there is a wide range of minority participation in each of the minority groups across the colleges. In the case of Hispanics, for example, the State's largest minority group, eight of the fifteen community colleges in the State have less than statewide average of 10.5 percent Hispanic students. At the extremes, South Mountain's student population includes 42.9 percent Hispanics, while the comparable figure for Scottsdale is 1.8 percent.

Consonant with the marked variation in minority participation across the fifteen community colleges, some institutions are providing more access to minorities than others. If equal access is operationalized to mean that the student population of a college and the population of the county in which it is located are similar with respect to minority size and composition, there are substantial differences in the extent to which individual institutions are achieving this goal. At one extreme, Maricopa Tech and South Mountain have a greater percentage of minority students than the percentage of minorities in the county (Maricopa) in which they are located. At the other extreme, Scottsdale has a minority enrollment of only 5.9 percent which is nearly 12 percent less than the population of the county in which it is located (Maricopa). (It should be noted that Maricopa is a large county and some cities, such as Scottsdale, have a markedly different minority population size and composition than the overall county. Hence the degree of under-

representation may be over-stated in this and other instances, if it is assumed that the city--rather than the county--is the more appropriate comparison.) In between these two extremes fall the other thirteen community colleges. In varying degrees each of these two-year colleges has an overall percentage of minorities that is less than the minority percentage for the appropriate county, though in some instances a college has one or more of the four major minority sub-groups represented in greater proportion than in the county in which it is located.

## **Minority Participation in the State Universities**

In Arizona's three public universities, where the overall proportion of minority students is considerably less than in the two-year colleges, there is much less variation in overall minority enrollment patterns between institutions (see Table 13). At one end of the continuum, the University of Arizona enrolls 8.6 percent minority students, while at the other, Northern Arizona University enrolls 11.2 percent minorities. There is, however, slightly more variation with respect to the enrollment patterns of specific minority groups. Most noteworthy, Northern Arizona University has a much higher proportion of Native Americans and a much lower proportion of Asians and Pacific Islanders than the other two institutions.

If equal access is operationalized to mean that the student population of a university and the population of the state are similar with respect to minority size and composition, all three state universities fall far short of providing access. Northern Arizona University, with the largest proportion of minorities among the three state universities, has a minority percentage that is more than fourteen percentage points below the combined percentage of minorities in the Arizona population. When the minority population is broken into sub-groups, only Asians and Pacific Islanders at the University of Arizona and Arizona State University are represented in roughly the same proportion as in the general population of the state. All of the other minorities are substantially underrepresented at all three state universities. Thus, with only one exception (Asians and Pacific Islanders), the state's three universities may be said to have fallen short of providing equal access to minorities.

## **Summary**

As would be expected, there is much more variation in minority participation across the two-year colleges than state universities. Indeed there is only minor variation in the latter institutions, especially in terms of overall minority participation, but also in terms of the minority sub-populations. Overall, all but four community colleges have gone further than all three of the universities toward achieving the goal of equal access for minorities, notwithstanding the wide variation in minority participation across all fifteen community colleges in the state. In the final analysis, however, the central finding of this paper remains unaffected by this examination of minority participation in individual institutions: although, a few community colleges can be said to have provided equal access to minorities, almost all two-year institutions and especially the state universities have fallen short of the state goal of providing equal access for the minority population of Arizona.

## **Issues Related to Minority Participation In Higher Education In Arizona**

As this paper has made clear, a gap currently exists between the demographic characteristics of the state's minority population and the realities of minority participation in higher education. On the one hand, the minority population continues to grow in size and racial and ethnic diversity. On the other hand, minority participation in education is severely limited compared to the non-minority population, especially at the apex of the educational pyramid--the graduate level in Arizona's three senior institutions. Placed in this context, the future of minority participation in higher education can be viewed as a drama set on the stage of the changing demographic characteristics of Arizona's minority population.

A major purpose of higher education in Arizona is to provide educational opportunities for all of Arizona's citizens. Accordingly, it follows from this analysis that we must respond more systematically to the new demographics, framing institutional responses that will enhance minority participation and minority success throughout the educational infrastructure. Based on the analysis presented here, what kinds of considerations might inform individual and institutional initiatives designed to enhance minority participation in higher education in the State of Arizona? Three broad categories of response are discussed below.

### **Understanding the Demographic Challenge**

This paper has sketched a demographic profile of the state's minority population, highlighting its substantial size and multi-cultural character. While this profile can provide a useful point of departure for shaping higher education's response to Arizona's minority population, there remains a clear and compelling need for comprehensive and accurate statewide data on the minority populations. For aside from United States census data and occasional population studies by the Department of Economic Security, there is a paucity of data regarding the changing size and character of the state's minority population.

It would be highly advisable for the State of Arizona--probably through its Department of Economic Security--to develop a longitudinal data base for looking at past trends, examining current trends, and predicting future trends in the minority population. Such a data base should, as a minimum, include information on the size, distribution, age, and English fluency of each minority group in the state as well as the total minority population. Moreover, ongoing ethnographic profiles of the different cultural groups would provide information needed for developing effective strategies for attracting and retaining minority students. If institutions and state policy-makers alike are to plan for future minority participation, they must have valid and reliable information about the current minority population and sound predictions about its future size and composition.

### **Monitoring Minority Participation and Success**

It has been established that minority participation in education in comparison to that of the non-minority population varies directly with the level of education: the higher the level, the less the minority participation. That minorities have not

achieved equal access throughout the pipeline is a significant finding, yet minority participation provides only a partial indicator of minority success at each level and at each institution in the pipeline. In order to more fully assess minority success in higher education, it is also necessary to determine at which grades or levels, or after which levels, most leakage occurs. At what points, and why, do minorities drop out of the pipeline?

In order to investigate minority leakage, it is necessary for high schools and colleges--in concert with the appropriate governing and coordinating boards--to collect comparable data on minority success at each level and each institution in the educational pipeline. By using graduation rates (or ideally, cohort survival date) to monitor minority success at each level and institution in the educational pipeline, institutions and state agencies can go a long way toward identifying leakage points with increased precision. In turn, the size and location of major leakage points for each minority group should influence strategies designed to increase minority participation, retention, and completion.

Complementing data collection efforts aimed at pinpointing minority progress should be institutional and statewide studies targeted at identifying factors contributing to minority persistence and drop-out throughout the educational pipeline. In other words, why do minorities remain in or leave school when they do? For obvious reasons, answers to this question may help institutions to adopt strategies for attracting and retaining minority students.

Beyond data collection efforts, the findings presented here regarding minority participation suggest that virtually all institutions in Arizona need to reexamine their current efforts to attract, retain, and serve minority students. What programs are working, and which ones are not? Evaluation of current efforts can provide a foundation for increasing both the quantity and the quality of minority involvement in higher education.

## **Framing Responses to the Changing Demographics**

Notwithstanding the need for additional data on minorities and minority success in higher education, the major implication of this study can be stated simply: both postsecondary institutions and state agencies need to develop new strategies of response to help promote minority participation and success throughout the educational pipeline.

In framing intervention strategies, it may be helpful for institutions to consider the following questions:

Since the minority population in Arizona is highly diverse—including a large number of Hispanics and Native Americans as well as Blacks and Asians and Pacific Islanders—to what extent should institutional intervention strategies be adapted to specific minority groups instead of targeted at the minority population as a whole?

How do current policies—such as efforts at Arizona State University to raise entrance requirements—affect efforts to increase minority participation and success in higher education?

What kinds of collaborative initiatives among community colleges, universities, and high schools can be designed to improve the quality of high school education for minorities?

What kinds of initiatives can be designed to restructure admissions and attendance patterns in institutions, such as new options for talented students, experimental admissions criteria, and new articulation arrangements?

What kinds of initiatives can be designed to improve the quality of curricula, instruction, and advising for culturally-diverse students?

For the appropriate state agencies, including but not limited to the Board of Regents and the State Board for Community Colleges, several additional questions may help to inform initiatives to enhance minority involvement in higher education:

Given the large proportion of minorities that comprise the state's rural population, coupled with the fact that the three major universities are located in the urban centers of the state, how can the senior institutions more effectively recruit rurally-located minorities so as to provide minorities with opportunities for upper-division and graduate work? If not, what steps can be taken to provide further educational opportunities for minorities living in rural areas?

How can both public and independent institutions throughout the state be encouraged to attract, retain, and better serve minority students?

How can collaborative efforts among high schools, community colleges, and universities be encouraged in order to enhance minority participation throughout the educational pipeline?

How can the state insure that all high school graduates are adequately prepared to participate in higher education?

## Summary

Like most states in the Southwest, Arizona has a sizeable and diverse minority population. Yet despite the efforts of many individuals and institutions throughout the state, minorities are highly underrepresented throughout the educational pipeline. If the commitment to equal opportunity is to be honored, individual institutions and state policy-makers alike must initiate new efforts aimed at enhancing the minority experience throughout the educational pipeline.

In a broad sense, this paper might serve as a point of departure for at least some of those efforts. Demographic trends and minority participation rates have been brought into focus, and three broad categories of response have been discussed in the concluding section. Yet much remains to be done. Out of this broad framework must emerge new approaches and initiatives for improving educational opportunities for minorities. It is a commitment not to be taken lightly.

(Publication has been reprinted from THE DEMOGRAPHIC TRANSFORMATION OF ARIZONA: IMPLICATIONS FOR MINORITY PARTICIPANTS IN HIGHER EDUCATION by Clifton F. Conrad and Mary Talbott, published by the Center for the Study of Higher Education, College of Education, University of Arizona, Topical Paper No. 21, September 1983, with minor editorial changes.)

**TABLE 1**  
**Population of Arizona, By Racial/Ethnic Group**

Racial/Ethnic Group	Population of Racial/Ethnic Group	Percentage of State Population
White	2,240,761	82.4
Black	74,977	2.8
American Indian, Eskimo, and Aleut	152,745	5.6
Asian and Pacific Islander	22,032	.8
Spanish Origin	440,701	16.2
Other <sup>a</sup>	227,700	8.4
Total	2,718,215	

<sup>a</sup>Because individuals included in the "Other" category of the 1980 Census are not identified as minorities, the above percentages underestimate the minority population.

Source: U.S. Department of Commerce, Bureau of Census, *1980 Census of Population*, "General Population Characteristics," p. 4-122.

Editor's notes.

1. For a more complete understanding of these data, the reader is referred to the Census document cited, specifically to Table B-1, where Arizona residents are divided by both race and origin—into White and non-White categories on the one hand and into Spanish origin and non-Spanish origin on the other. The present table combines these categories so that those listed above as Spanish origin are also counted a second time in the White, Black, etc., rows. This explains why the total is off by the 440,701 number of Spanish origin, and why the percentage column actually totals to 116.2%.

2. Arizona's Eskimo and Aleut population in 1980 was 247 persons. The "Pacific Islanders" are Hawaiians, Guamanians and Samoans and totalled 1307. cf. Table 15 of the cited work.
